The interrelationship between the soil and agricultural
implements is considered. An analysis is made of
forces, stresses, and other physical changes of the
soil under tillage operations. The theoretical compo-
nents of work are compared with experimental values.
Changes to the physical characteristics of the soil by
machine tillage are examined.

From the results on the optimum form of oscillation of
a tool in the shape of an inclined plane, conclusions
were drawn about the choice of oscillation character-

An oscillating plough body, in which the share and
mouldboard oscillated in different directions in space
and in opposite phase, was constructed on the basis of
